**Course: COMP2171 – Object Oriented Design and Implementation**

# Problem Statement

We want our software product to provide efficiency for the local aviation industry where aircraft maintenance engineers can spend more time fixing planes than doing tedious paperwork.

Currently, the system used to log and calculate hours is tedious to use and consumes too much time.

If aircraft maintenance engineers are spending more time behind a computer than in the hangar ensuring aircraft are fit and safe to fly, they could be exhausted from the time it takes to use the system and the backed-up maintenance work to be done. This exhaustion could potentially cause the engineer to overlook any defects which may have catastrophic consequences. We will use an object-oriented program to automate most of the calculations that need to be done.

# Functional Requirements

**Requirement #1:** Update Aircraft Component Maintenance status

**Use Case:**

**Rationale:** Each aircraft component has its own maintenance countdown and is required to be maintained after a specific set of hours. This system is necessary for keeping track of all the separate components and their individual countdowns..

**User Requirement:** The system shall allow the user to create a new entry in the plane's status report

**System Requirements:**

1. The system shall accept date, time, aircraft name and flight time
2. The user shall be allowed to validate input and edit inputs before submission
3. The system shall allow the displaying of the plane's new status report

**Acceptance Criteria:** 1. The system is able to save new maintenance rates after an update and display new status report entry 100% of the time

**Relates to/Dependencies:** This requirement relates to requirement numbers 2 and 3

Priority: High

**Requirement #2:** Organise list to prioritise aircrafts parts in need of maintenance

**Use Case:**

**Rationale:** Aircrafts with more parts in need of maintenance have a higher probability to experience failure of some nature. This can be avoided by doing maintenance check-ups on such aircrafts.

**User Requirement:** N/A

**System Requirements:** 1. System shall assign each plane with a maintenance number based on how many parts need to be inspected.

2. System shall display a sorted list of planes from high maintenance number to low.

3. System shall display a sorted list of parts based on maintenance needs.

**Acceptance Criteria:** 1. The system is able to display a sorted list of planes from highest to lowest maintenance number.

**Relates to/Dependencies:** This requirement relates to requirement number 1.

**Priority:** High

**Requirement #3:** Calculate remaining hours until maintenance.-

**Use Case:**

**Rationale:** Each airplane part has a specified number of flight hours until they need to be serviced. Keeping track of this can be tedious due to the amount of parts and can lead to miscalculations.

**User Requirement:** The system shall accept values inputting in requirement 1.

**System Requirements:**1. System shall accept maintenance hours and flight hours and calculate the difference.

**Acceptance Criteria:** 1. The system is able to calculate the difference between the specified maintenance hours and the flight hours of each part.

**Priority:** High

**Requirement #4:** Display reports to the user

**Use Case:**

**Rationale:** Each aircraft has their own maintenance rate, and it is crucial to keep track of this. In addition, it is costly to maintain and replace parts/components. Therefore, reports need to be generated to keep track of the aircraft components status and the cost to maintain these components

**User Requirement:** The system shall display a specific report to the user based on what they selected

**System Requirements:**1. The system shall accept and store data such as maintenance cost, date, time and name of components in specific files which are your reports

2. The system shall give the users an update option which allows them to add more data in the report and their own comments

3. The system shall allow the displaying of the plane's new status report or the monthly expense

4. the system shall save reports made so the user can check reports from previous months

**Acceptance Criteria:** 1. The system is able to display and save specific reports to the user

Relates to/Dependencies: this relates to requirement 1,2 and 3.

**Priority:** High

**Requirement #5:** . Alert user of upcoming maintenance.

**Use Case:** View Alerts, View Operations Report, View Components Report

**Rationale:** Due to the amount of parts that each plane has and the amount of planes that could possibly be in the aerodrome at any given point, it can be hard to keep track of which part needs to be serviced when.

**User Requirement:** The system will ask the user if they wish to view alerts

**System Requirements:**1. The system shall display a visible message informing the user upon login, of upcoming maintenance checks.

2. The system will calculate the time since the last update on a component

**Acceptance Criteria:** 1. The system is able to inform the user of upcoming maintenance checks.

**Relates to/Dependencies:** this relates to requirement 1,2

**Priority:** High

**Requirement #6:** Maintenance Documentation

**Use Case:**

**Rationale:** Proper documentation of each serviced part is needed. Inclusive of maintenance expenses and airworthy certification.

**User Requirement:** The system will prompt the user for maintenance documentation.

**System Requirements:**1. The system shall be able to accept the documentation associated with a serviced part.

**Acceptance Criteria:** 1. The system is able to accept the documentation.

**Relates to/Dependencies:** this relates to requirements 1,4,

**Priority:** High

# Non-Functional Requirements

## Performance Requirements

1. Any calculation will not take more than 10 seconds.
2. The displaying of any report will not take more than 15 seconds.
3. The generating of a monthly report will not take more than 15 seconds.

## Safety and Security Requirements

- This software will ask the user to validate the data they enter as the data entered is extremely sensitive and if the user were to make a mistake it could lead to damage or possible loss.
- This software will create backups of data in order to prevent the loss of data due to file corruption or failure due to any third party interferences such as a power outage.
- There will be a simple login protocol where engineers have sole access to the system in which they will be able to input and retrieve the data generated. This will safeguard the data from being manipulated by persons who may want to change the data which may cause loss of property due product (plane) extending service life.

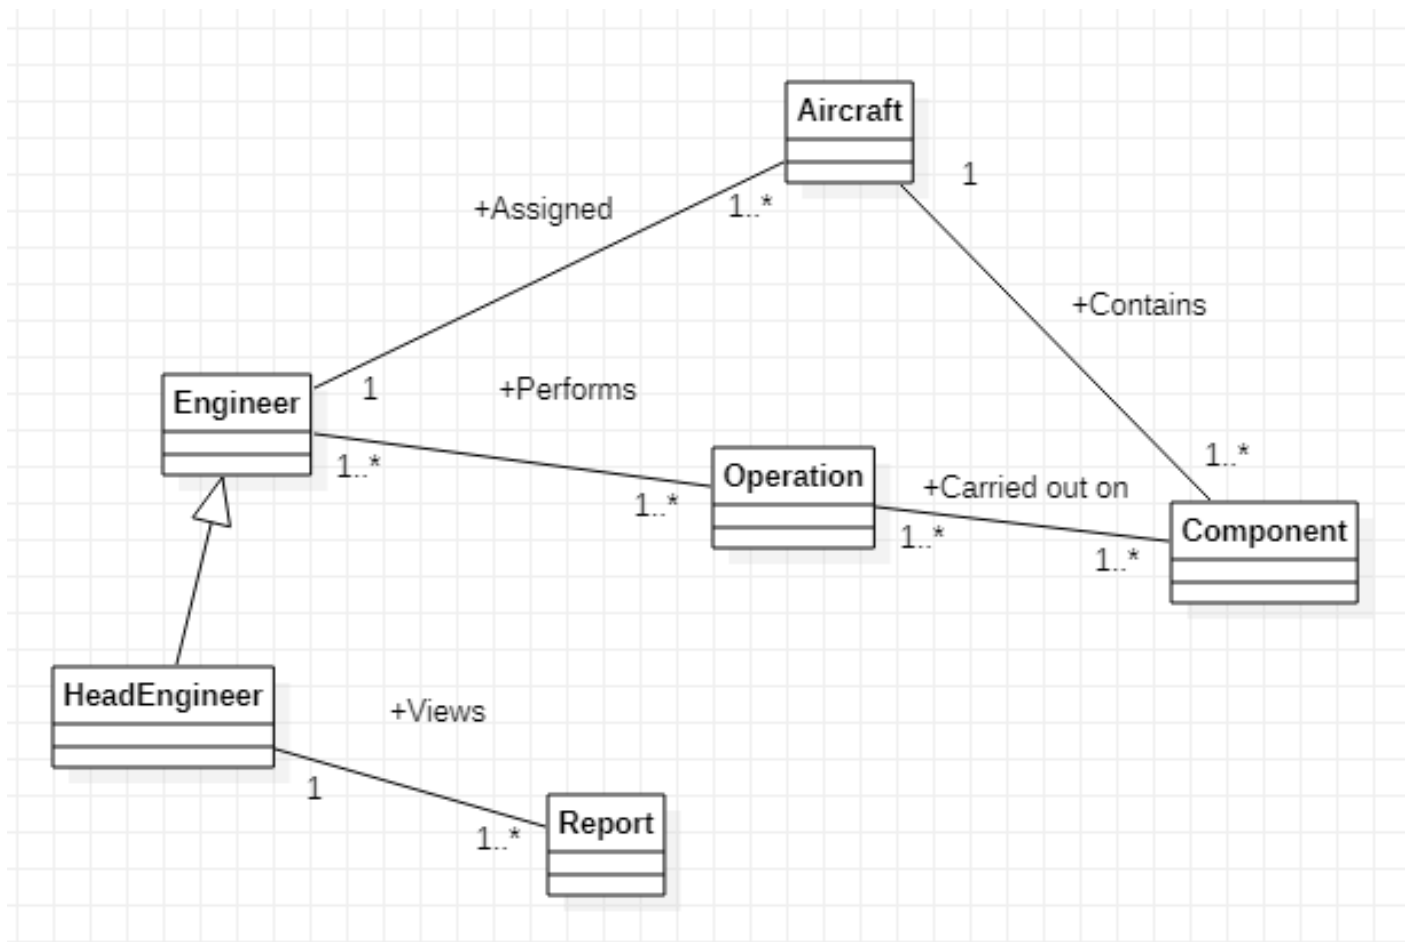

## Software Quality Attributes

**Correctness:** This software will be correct in its calculations and reports through information given by the user.

**Usability:** This software will satisfy a number of needs specified by the engineer.

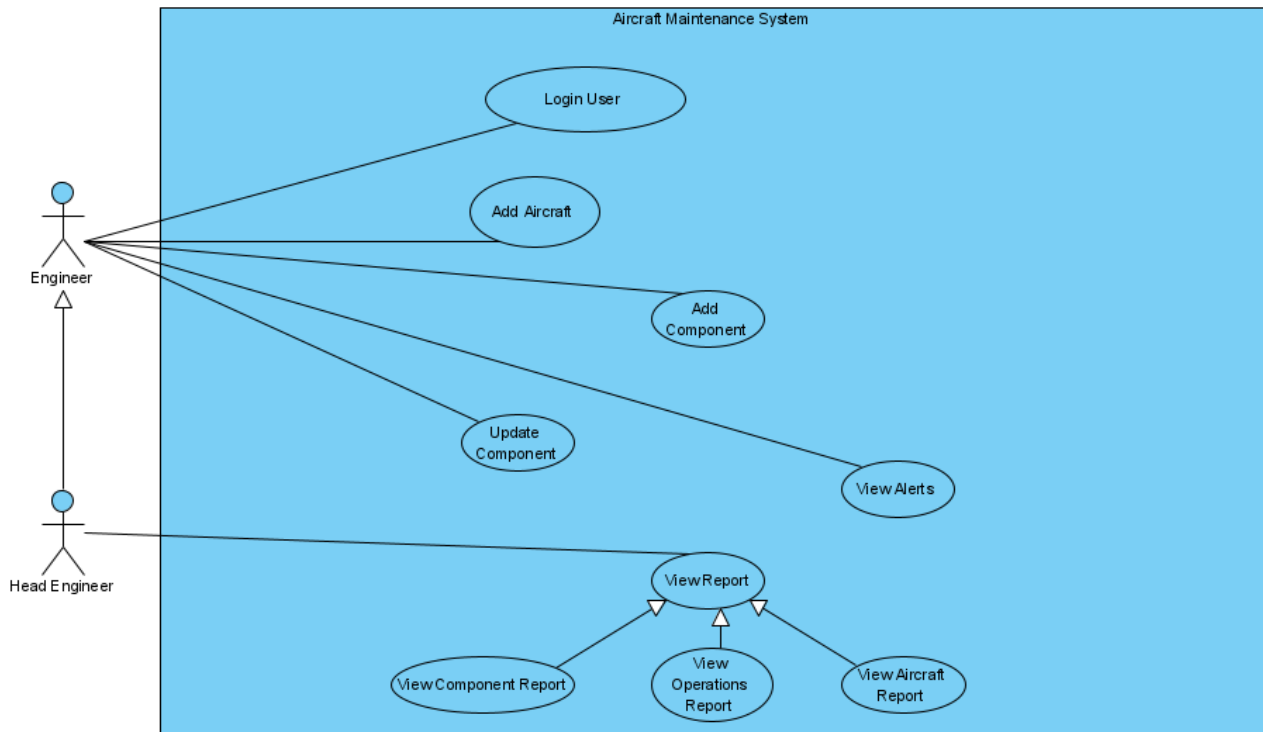

**Portability:** This software will be portable as the platform the software will be using is Java which is executable on all major platforms.

# Domain Model

# Use Case Diagram

# Use Case Description

<b>Name</b>	Login User
<b>Related Requirements</b>	
<b>Goal in Context</b>	An engineer can log in to the system so they can perform various actions such as viewing and updating information for aircrafts
<b>Pre Condition</b>	System must be available and running
<b>Successful End Condition</b>	Engineer logs in
<b>Fail End Condition</b>	System rejects user based on inaccurate login credentials
<b>Primary Actors</b>	Engineer, Engineer Credential Database
<b>Trigger</b>	User clicks the login button
<b>Main Flow</b>	<ol style="list-style-type: none"><li>1. User opens system and is met with a login screen on startup</li><li>2. User enter credentials and is either accepted or rejected</li></ol>

<b>Name</b>	Add Aircraft
<b>Related Requirements</b>	1
<b>Goal in Context</b>	To add a new aircraft to keep track of in the system
<b>Pre Condition</b>	System is functioning properly and engineer has logged in
<b>Successful End Condition</b>	A new aircraft has been added to the list of aircrafts
<b>Fail End Condition</b>	System fails to add a new aircraft
<b>Primary Actors</b>	Engineer
<b>Trigger</b>	Engineer select “Add Aircraft” option
<b>Main Flow</b>	<ol style="list-style-type: none"> <li>1. Engineer clicks on “Add Aircraft” option and is shown a form to fill out the aircraft information</li> <li>2. Engineer fills out form and attempts to add aircraft</li> <li>3. System notifies user on whether the aircraft was accepted or not</li> </ol>

<b>Name</b>	Add Component
<b>Related Requirements</b>	1
<b>Goal in Context</b>	To add a new component for a specific aircraft in the system
<b>Pre Condition</b>	System is functioning properly and engineer has logged in
<b>Successful End Condition</b>	New component added
<b>Fail End Condition</b>	Component fails to be added
<b>Primary Actors</b>	Engineer
<b>Trigger</b>	Engineer select “Add component” option
<b>Main Flow</b>	<ol style="list-style-type: none"> <li>1. Engineer clicks on “Add Component” option and is shown a form to fill out details about the component</li> <li>2. Engineer fills out details and the system confirms that the component is added</li> </ol>

<b>Name</b>	Update Component
<b>Related Requirements</b>	1
<b>Goal in Context</b>	To update information about a component or several components on an aircraft
<b>Pre-Condition</b>	System is functioning properly and engineer has logged in with the proper credentials (has to be a head engineer)
<b>Successful End Condition</b>	Component/components have been updated
<b>Fail End Condition</b>	Information failed to be updated, User was prevented from attempting to update anything because they did not have permission to edit this information
<b>Primary Actors</b>	Engineer
<b>Trigger</b>	Head engineer clicks on the “Update Component” button
<b>Main Flow</b>	<ol style="list-style-type: none"> <li>1. Head engineer clicks on the “Update Component” button</li> <li>2. Engineer then has the option to choose whether they want to update a specific component or the flight time for the aircraft</li> </ol>

<b>Name</b>	View Alerts
<b>Related Requirements</b>	5
<b>Goal in Context</b>	To alert and allow the engineer to view important information
<b>Pre Condition</b>	System is functioning properly and engineer has logged in
<b>Successful End Condition</b>	Engineer is alerted and can click “Okay” to dispel alert
<b>Fail End Condition</b>	Alert doesn't disappear
<b>Primary Actors</b>	Engineer
<b>Trigger</b>	Engineer logs in or clicks on “View alerts button”
<b>Main Flow</b>	<ol style="list-style-type: none"> <li>1. Engineer logs in</li> <li>2. Engineer is greeted with an alert or clicks on “View Alert” button</li> <li>3. Engineer click “Okay” to dispel alert</li> </ol>

<b>Name</b>	View Component Report
<b>Related Requirements</b>	5
<b>Goal in Context</b>	To show the engineer a generated report on a certain component or components
<b>Pre Condition</b>	System is functioning properly and engineer has logged in
<b>Successful End Condition</b>	Engineer is shown a report on the specific component/components requested
<b>Fail End Condition</b>	There is no report shown to the engineer
<b>Primary Actors</b>	Engineer
<b>Trigger</b>	Engineer clicks on “View Component Report” button
<b>Main Flow</b>	<ol style="list-style-type: none"> <li>1. After clicking on “View Component Report” the engineer is then taken to a new screen so they can select what report they would like to see</li> <li>2. Engineer selects and is shown a report.</li> </ol>

<b>Name</b>	View Operations Report
<b>Related Requirements</b>	5
<b>Goal in Context</b>	To show the engineer a generated report on the recent operations that took place
<b>Pre Condition</b>	System is functioning properly and engineer has logged in
<b>Successful End Condition</b>	Engineer is shown a report on the recent operations that took place
<b>Fail End Condition</b>	There is no report shown to the engineer
<b>Primary Actors</b>	Engineer
<b>Trigger</b>	Engineer clicks on “View Operations Report”
<b>Main Flow</b>	<ol style="list-style-type: none"> <li>1. After clicking on “View operations Report” the engineer is then taken to a new screen where it shows the title and dates of the different operations that have taken place on the aircraft components</li> <li>2. Engineer selects a report and is shown the details of that report</li> </ol>

<b>Name</b>	View Aircraft Report
<b>Related Requirements</b>	
<b>Goal in Context</b>	To show the engineer a generated report on the recent operations that took place and all components for a select aircraft.
<b>Pre Condition</b>	System is functioning properly and engineer has logged in
<b>Successful End Condition</b>	Engineer is shown a report on the aircraft selected
<b>Fail End Condition</b>	System fails to show report to the engineer
<b>Primary Actors</b>	Engineer
<b>Trigger</b>	Engineer selects “View Aircraft Report” button
<b>Main Flow</b>	<ol style="list-style-type: none"> <li>1. After clicking on “View Aircraft Report” the engineer is then taken to a new screen where it shows the names and ID of the different aircrafts</li> <li>2. Engineer selects a aircraft and is shown a report on the aircrafts</li> </ol>
